## Qu 17(b) continued

Way 1 :
M1: Uses the negative of their previous tangent gradient or uses a correct $-\frac{12}{5}$ or $\frac{12}{5}$
M1: Attempts the second tangent equation and puts $x=0$ or uses vectors to find intercept
e.g. $\frac{11-y}{10}=m^{\prime}$

Way 2:
M1: Finds midpoint of $P Q$ from symmetry. (This is at $(0,6)$ )
M1: Uses this midpoint to find second intercept or to find difference between midpoint and first intercept. e.g. $35-6=29$ then $6-29=-23$ so second intercept is at $(-23,0)$

Ways 1 and 2:
A1*: Obtain 58 correctly from a valid method.
